Thrust is the CUDA analog of the Standard Template Library (STL) of C++. It comes with any installation of CUDA 4.2 and above and features:

- ▶ Dynamic data structures
- ▶ An encapsulation of GPU/CPU communication, memory management, and other low-level tasks.
- ▶ High-performance GPU-accelerated algorithms such as sorting and reduction

vector1.cu |

```
#include <thrust/host_vector.h>
#include <thrust/device_vector.h>
#include <iostream>

int main(void){

    // H has storage for 4 integers
    thrust::host_vector<int> H(4);

    // initialize individual elements
    H[0] = 14;
    H[1] = 20;
    H[2] = 38;
    H[3] = 46;

    // H.size() returns the size of vector H
    std::cout << "H has size " << H.size() << std::endl;
}
```

- ▶ Thrust takes care of `malloc()`, `cudaMalloc()`, `free()`, and `cudaFree()` for you without sacrificing performance.
- ▶ The “`=`” operator does a `cudaMemcpy()` if one vector is on the host and one is on the device.
- ▶ `thrust::` and `std::` clarify the *namespace* of the function after the double colon. For example, we need to distinguish between `thrust::copy()` and `std::copy()`.
- ▶ The “`<<`” operator sends a value to an output stream, an alternative to `printf()`.

```
thrust::host_vector<int> H(D.begin(), D.begin()
    + 5);

// set the elements of H to 0, 1, 2, 3, ...
thrust::sequence(H.begin(), H.end());

// copy all of H back to the beginning of D
thrust::copy(H.begin(), H.end(), D.begin());

// print D
for(int i = 0; i < D.size(); i++)
    std::cout << "D[" << i << "] = " << D[i] <<
    std::endl;

return 0;
}
```

```
[landau@impact1 vector2]$ make  
nvcc vector2.cu -o vector2  
[landau@impact1 vector2]$ ./vector2  
D[0] = 0  
D[1] = 1  
D[2] = 2  
D[3] = 3  
D[4] = 4  
D[5] = 9  
D[6] = 9  
D[7] = 1  
D[8] = 1  
D[9] = 1  
[landau@impact1 vector2]$
```

Assignment

- ▶ `thrust::copy()` copies a section of one vector into a section of another.
- ▶ `thrust::fill()` sets a range of elements to some fixed value.
- ▶ `thrust::sequence()` assigns equally-spaced values to a section of a vector.

Reordering

Sorting

- ▶ Declaring vectors:
 - ▶ `thrust::device_vector<T> D;` creates a vector D with entries of data type T on the device.
 - ▶ The analogous declaration for host vectors is `thrust::host_vector<T> H;`.
- ▶ An object D of the vector template class includes the following features:
 - ▶ A dynamic linear array of elements of type T.
 - ▶ Two *iterators*:
 - ▶ `D.begin()`
 - ▶ `D.end()`

An iterator is a pointer with a C++ wrapper around it. The wrapper contains additional information, such as whether the vector is stored on the host or the device.

```
// allocate device vector
thrust::device_vector<int> d_vec(4);

d_vec.begin(); // returns iterator at first
               element of d_vec
d_vec.end(); // returns iterator one past the
              last element of d_vec

// [begin, end) pair defines a sequence of 4
elements
```

```
// allocate device vector
thrust::device_vector<int> d_vec(4);

thrust::device_vector<int>::iterator begin =
    d_vec.begin();

*begin = 13; // same as d_vec[0] = 13;
int temp = *begin; // same as temp = d_vec[0];

begin++; // advance iterator one position

*begin = 25; // same as d_vec[1] = 25;
```

[Getting Started](#)[Iterators](#)[Basic iterators](#)[constant_iterator](#)[counting_iterator](#)[transform_iterator](#)[permutation_iterator](#)[zip_iterator](#)[Containers](#)[Algorithms](#)[Transformations](#)[Reductions](#)[Scans](#)[Reordering](#)[Sorting](#)

```
int N = 10;

// raw pointer to device memory
int * raw_ptr;
cudaMalloc((void **) &raw_ptr, N * sizeof(int));

// wrap raw pointer with a device_ptr
thrust::device_ptr<int> dev_ptr(raw_ptr); // use
    device_ptr in thrust algorithms
thrust::fill(dev_ptr, dev_ptr + N, (int) 0); // 
    access device memory through device_ptr

dev_ptr[0] = 1;

// free memory
cudaFree(raw_ptr);
```

Unwrap iterators to extract pointers.

```
// allocate device vector
thrust::device_vector<int> d_vec(4);

// obtain raw pointer to device vector's memory
int * ptr = thrust::raw_pointer_cast(&d_vec[0]);
    // use ptr in a CUDA C kernel
my_kernel<<<N/256, 256>>>(N, ptr);

// Note: ptr cannot be dereferenced on the host!
```

constant_iterator

A `constant_iterator` is a pointer with some constant value associated with it.

```
#include <thrust/iterator/constant_iterator.h>
...
// create iterators
thrust::constant_iterator<int> first(10);
thrust::constant_iterator<int> last = first + 3;

first[0]; // returns 10
first[1]; // returns 10
first[100]; // returns 10

// sum of [first , last)
thrust::reduce(first , last); // returns 30 (i.e.
    3 * 10)
```

counting_iterator

A `counting_iterator` is a pointer with the value `<some constant> + <offset>` associated with it.

```
#include <thrust/iterator/counting_iterator.h>
...
// create iterators
thrust::counting_iterator<int> first(10);
thrust::counting_iterator<int> last = first + 3;

first[0]; // returns 10
first[1]; // returns 11
first[100]; // returns 110

// sum of [first , last)
thrust::reduce(first , last); // returns 33 (i.e.
    10 + 11 + 12)
```

```
#include <thrust/iterator/transform_iterator.h>
...
thrust::device_vector<int> vec(3);
vec[0] = 10;
vec[1] = 20;
vec[2] = 30;

// create iterator
thrust::transform_iterator<int> first =
    thrust::make_transform_iterator(vec.begin(),
        negate<int>());
thrust::transform_iterator<int> last =
    thrust::make_transform_iterator(vec.end(),
        negate<int>());
```

first[0] // returns -10
first[1] // returns -20
first[2] // returns -30

thrust::reduce(first, last); // returns -60 (i.e.
    -10 + -20 + -30)

// same thing:
thrust::reduce(
    thrust::make_transform_iterator(
        vec.begin(), negate<int>()),
    thrust::make_transform_iterator(
        vec.end(), negate<int>()));
```

permutation_iterator I

A `permutation_iterator` is a pointer associated with a permuted vector.

```
#include <thrust/iterator/permutation_iterator.h>
...
thrust::device_vector<int> map(4);
map[0] = 3;
map[1] = 1;
map[2] = 0;
map[3] = 5;

thrust::device_vector<int> source(6);
source[0] = 10;
source[1] = 20;
source[2] = 30;
source[3] = 40;
source[4] = 50;
source[5] = 60;

typedef thrust::device_vector<int>::iterator indexIter;

thrust::permutation_iterator<indexIter, indexIter> pbegin =
    thrust::make_permutation_iterator(
        source.begin(), map.begin())

thrust::permutation_iterator<indexIter, indexIter> pend =
    thrust::make_permutation_iterator(
        source.end(), map.end())

A container is any of the following template classes in the C++ Standard Template Library (STL):

- ▶ `vector`
- ▶ `deque`
- ▶ `list`
- ▶ `tack`
- ▶ `queue`
- ▶ `priority_queue`
- ▶ `set`
- ▶ `multiset`
- ▶ `map`
- ▶ `multimap`
- ▶ `biset`

container.cu I

Thrust only implements vectors, but it's still compatible with the rest of STL's template classes:

```
#include <thrust/device_vector.h>
#include <thrust/copy.h>
#include <list>
#include <vector>

int main(void){
    // create an STL list with 4 values
    std::list<int> stl_list;
    stl_list.push_back(10);
    stl_list.push_back(20);
    stl_list.push_back(30);
    stl_list.push_back(40);

    // initialize a device_vector with the list
    thrust::device_vector<int> D(stl_list.begin(),
        stl_list.end());
```

container.cu II

```
// copy a device_vector into an STL vector
std::vector<int> stl_vector(D.size());
thrust::copy(D.begin(), D.end(), stl_vector.
             begin());

return 0;
}
```

Output:

```
[landau@impact1 container]$ make
nvcc container.cu -o container
[landau@impact1 container]$ ./container
[landau@impact1 container]$
```

- ▶ A transformation is the application of a function to each element within a range of elements in a vector. The results are stored as a range of elements in another vector.
- ▶ Examples:
 - ▶ `thrust::fill()`
 - ▶ `thrust::sequence()`
 - ▶ `thrust::replace()`
 - ▶ `thrust::transform()`

transformations.cu I

```
#include <thrust/device_vector.h>
#include <thrust/transform.h>
#include <thrust/sequence.h>
#include <thrust/copy.h>
#include <thrust/fill.h>
#include <thrust/replace.h>
#include <thrust/functional.h>
#include <iostream>

int main(void) {
    // allocate three device_vectors with 10
    // elements
    thrust::device_vector<int> X(10);
    thrust::device_vector<int> Y(10);
    thrust::device_vector<int> Z(10);

    // initialize X to 0,1,2,3, ....
    thrust::sequence(X.begin(), X.end());
```

Getting Started

Iterators

- Basic iterators
- constant_iterator
- counting_iterator
- transform_iterator
- permutation_iterator
- zip_iterator

Containers

Algorithms

- Transformations
- Reductions
- Scans
- Reordering
- Sorting

```
int sum = thrust::reduce(D.begin(), D.end(),
    (int) 0, thrust::plus<int>());  
  
int sum = thrust::reduce(D.begin(), D.end(),
    (int) 0);  
  
int sum = thrust::reduce(D.begin(), D.end())
```

- ▶ The third argument is the starting value of the reduction.
- ▶ The fourth argument is the binary operation that defines the kind of reduction.

Counting

Another reduction: use `thrust::count()` to count the number of times a value appears in a vector

```
#include <thrust/count.h>
#include <thrust/device_vector.h>
...
// put three 1s in a device_vector
thrust::device_vector<int> vec(5,0);

vec[1] = 1;
vec[3] = 1;
vec[4] = 1;

// count the 1s
int result = thrust::count(vec.begin(), vec.end(),
                           1);
// result is three
```

```
#include <thrust/scan.h>
...
int data[6] = {1, 0, 2, 2, 1, 3};
thrust::inclusive_scan(data, data + 6, data);

/* data[0] = data[0]
 * data[1] = data[0] + data[1]
 * data[2] = data[0] + data[1] + data[2]
 * ...
 * data[5] = data[0] + data[1] + ... + data[5]
 */

// data is now {1, 1, 3, 5, 6, 9}
```

Scans

Getting Started

Iterators

Basic iterators

constant_iterator

counting_iterator

transform_iterator

permutation_iterator

zip_iterator

Containers

Algorithms

Transformations

Reductions

Scans

Reordering

Sorting

There are *exclusive scans* in addition to *inclusive scans*:

```
#include <thrust/scan.h>
...
int data[6] = {1, 0, 2, 2, 1, 3};
thrust::exclusive_scan(data, data + 6, data);

/* data[0] = 0
 * data[1] = data[0]
 * data[2] = data[0] + data[1]
 * ...
 * data[5] = data[0] + data[1] + ... + data[4]
 */

// data is now {0, 1, 1, 3, 5, 6}
```

Reordering

The “Reordering” utilities provides subletting and partitioning tools:

- ▶ `thrust::copy_if()`: copy the elements that make some logical function return true.
- ▶ `thrust::partition()`: reorder a vector such that values returning true precede values returning false.
- ▶ `thrust::remove()` and `remove_if()`: remove elements that return false.
- ▶ `thrust::unique()`: remove duplicates in a vector.

```
#include <thrust/partition.h>
...
struct is_even{
    __host__ __device__ bool operator()(const int &x){
        return (x % 2) == 0;
    }
};

int main(){
    int A[] = {1, 2, 3, 4, 5, 6, 7, 8, 9, 10};
    const int N = sizeof(A)/sizeof(int);
    thrust::partition(A, A + N,
                      is_even());
    // A is now {2, 4, 6, 8, 10, 1, 3, 5, 7, 9}
    return 0;
}
```

Getting Started

Iterators

- Basic iterators
- constant_iterator
- counting_iterator
- transform_iterator
- permutation_iterator
- zip_iterator

Containers

Algorithms

- Transformations
- Reductions
- Scans
- Reordering
- Sorting

Sorting I

`thrust::sort():`

```
#include <thrust/sort.h>
...
const int N = 6;
int A[N] = {1, 4, 2, 8, 5, 7};
thrust::sort(A, A + N);
// A is now {1, 2, 4, 5, 7, 8}
```

`thrust::sort_by_key():`

```
#include <thrust/sort.h>
...
const int N = 6;
int keys[N] = { 1, 4, 2, 8, 5, 7};
char values[N] = {'a', 'b', 'c', 'd', 'e', 'f'};
thrust::sort_by_key(keys, keys + N, values);
// keys is now { 1, 2, 4, 5, 7, 8}
// values is now {'a', 'c', 'b', 'e', 'f', 'd'}
```
