Thrust is the CUDA analog of the Standard Template Library (STL) of C++. It comes with any installation of CUDA 4.2 and above and features:

- Dynamic data structures
- An encapsulation of GPU/CPU communication, memory management, and other low-level tasks.
- High-performance GPU-accelerated algorithms such as sorting and reduction

vector1.cu l

```cpp
#include <thrust/host_vector.h>
#include <thrust/device_vector.h>
#include <iostream>

int main(void){

  // H has storage for 4 integers
  thrust::host_vector<int> H(4);

  // initialize individual elements
  H[0] = 14;
  H[1] = 20;
  H[2] = 38;
  H[3] = 46;

  // H.size() returns the size of vector H
  std::cout << "H has size " << H.size() << std::
      endl;
```

- ▶ Thrust takes care of malloc(), cudaMalloc(), free(), and cudaFree() for you without sacrificing performance.
- ▶ The "=" operator does a cudaMemcpy() if one vector is on the host and one is on the device.
- ▶ thrust:: and std:: clarify the *namespace* of the function after the double colon. For example, we need to distinguish between thrust::copy() and std::copy().
- ▶ The "¡¡" operator sends a value to an output stream, an alternative to printf().

- ▶ `thrust::copy()` copies a section of one vector into a section of another.
- ▶ `thrust::fill()` sets a range of elements to some fixed value.
- ▶ `thrust::sequence()` assigns equally-spaced values to a section of a vector.

The Vector Template Classes

- Declaring vectors:
    - `thrust::device_vector<T> D;` creates a vector D with entries of data type T on the device.
    - The analogous declaration for host vectors is `thrust::host_vector<T> H;`.
- An object Dof the vector template class includes the following features:
    - A dynamic linear array of elements of type T.
    - Two *iterators*:
        - `D.begin()`
        - `D.end()`

Sorting

An iterator is a pointer with a C++ wrapper around it. The wrapper contains additional information, such as whether the vector is stored on the host or the device.

```cpp
// allocate device vector
thrust::device_vector<int> d_vec(4);

d_vec.begin(); // returns iterator at first
    element of d_vec
d_vec.end(); // returns iterator one past the
    last element of d_vec

// [begin, end) pair defines a sequence of 4
    elements
```

Iterators act like pointers.

```
// allocate device vector
thrust :: device_vector <int> d_vec(4);

thrust :: device_vector <int >:: iterator begin =
    d_vec . begin ();
thrust :: device_vector <int >:: iterator end = d_vec .
    end ();

int length = end − begin; // compute the length
    of the vector

end = d_vec . begin () + 3; // define a sequence of
    3 elements
```

```cpp
// allocate device vector
thrust::device_vector<int> d_vec(4);

thrust::device_vector<int>::iterator begin =
    d_vec.begin();

*begin = 13; // same as d_vec[0] = 13;
int temp = *begin; // same as temp = d_vec[0];

begin++; // advance iterator one position

*begin = 25; // same as d_vec[1] = 25;
```

Wrap pointers to make iterators.

```
int N = 10;

// raw pointer to device memory
int * raw_ptr;
cudaMalloc((void **) &raw_ptr, N * sizeof(int));

// wrap raw pointer with a device_ptr
thrust::device_ptr<int> dev_ptr(raw_ptr); // use
    device_ptr in thrust algorithms
thrust::fill(dev_ptr, dev_ptr + N, (int) 0); //
    access device memory through device_ptr

dev_ptr[0] = 1;

// free memory
cudaFree(raw_ptr);
```

constant_iterator

A constant_iterator is a pointer with some constant value associated with it.

```cpp
#include <thrust/iterator/constant_iterator.h>
...
// create iterators
thrust::constant_iterator <int> first(10);
thrust::constant_iterator <int> last = first + 3;

first[0]; // returns 10
first[1]; // returns 10
first[100]; // returns 10

// sum of [first , last)
thrust::reduce(first, last); // returns 30 (i.e.
    3 * 10)
```

transform_iterator I

A transform_iterator is a pointer with the value <some function>(<vector entry>) associated with it.

```
#include <thrust/iterator/transform_iterator.h>
...
thrust::device_vector <int> vec(3);
vec[0] = 10;
vec[1] = 20;
vec[2] = 30;

// create iterator
thrust::transform_iterator <int> first =
  thrust::make_transform_iterator(vec.begin(),
      negate<int>());

thrust::transform_iterator <int> last =
  thrust::make_transform_iterator(vec.end(),
      negate<int>());
```

transform_iterator II

```
first [0]  // returns -10
first [1]  // returns -20
first [2]  // returns -30

thrust :: reduce ( first , last ); // returns -60 ( i . e .
    -10 + -20 + -30)

// same thing :
thrust :: reduce (
  thrust :: make_transform_iterator (
    vec . begin () , negate < int >()) ,
  thrust :: make_transform_iterator (
    vec . end () , negate < int >())) ;
```

permutation_iterator I

A permutation_iterator is a pointer associated with a permuted vector.

```cpp
#include <thrust/iterator/permutation_iterator.h>
...
thrust::device_vector <int> map(4);
map[0] = 3;
map[1] = 1;
map[2] = 0;
map[3] = 5;

thrust::device_vector <int> source(6);
source[0] = 10;
source[1] = 20;
source[2] = 30;
source[3] = 40;
source[4] = 50;
source[5] = 60;

typedef thrust::device_vector<int>::iterator indexIter;

thrust::permutation_iterator<indexIter, indexIter> pbegin =
  thrust::make_permutation_iterator(
    source.begin(), map.begin())

thrust::permutation_iterator<indexIter, indexIter> pend =
  thrust::make_permutation_iterator(
    source.end(), map.end())

A container one of the following template classes in the C++ Standard Template Library (STL):

- ► vector
- ► deque
- ► list
- ► tack
- ► queue
- ► priority_queue
- ► set
- ► multiset
- ► map
- ► multimap
- ► biset

container.cu I

Thrust only implements vectors, but it's still compatible with the rest of STL's template classes:

```cuda
#include <thrust/device_vector.h>
#include <thrust/copy.h>
#include <list>
#include <vector>

int main(void){
  // create an STL list with 4 values
  std::list<int> stl_list;
  stl_list.push_back(10);
  stl_list.push_back(20);
  stl_list.push_back(30);
  stl_list.push_back(40);

  // initialize a device_vector with the list
  thrust::device_vector<int> D(stl_list.begin(),
      stl_list.end());
```

container.cu II

```
// copy a device_vector into an STL vector
std::vector<int> stl_vector(D.size());
thrust::copy(D.begin(), D.end(), stl_vector.
    begin());

return 0;
}
```

Output:

```
[landau@impact1 container]$ make
nvcc container.cu -o container
[landau@impact1 container]$ ./container
[landau@impact1 container]$

- A transformation is the application of a function to each element within a range of elements in a vector. The results are stored as a range of elements in another vector.
- Examples:
  - `thrust::fill()`
  - `thrust::sequence()`
  - `thrust::replace()`
  - `thrust::transform()`

Reductions

A reduction algorithm uses a binary operation to reduce an
input vector to a single value. For example, here are
equivalent ways to code the pairwise sum:

```
int sum = thrust::reduce(D.begin(), D.end(),
  (int) 0, thrust::plus<int>());

int sum = thrust::reduce(D.begin(), D.end(),
  (int) 0);

int sum = thrust::reduce(D.begin(), D.end())
```

▶ The third argument is the starting value of the
  reduction.

▶ The fourth argument is the binary operation that
  defines the kind of reduction.

Reductions
Scans
Reordering
Sorting

Another reduction: use `thrust::count()` to count the
number of times a value appears in a vector

```
#include <thrust/count.h>
#include <thrust/device_vector.h>
...

// put three 1s in a device_vector
thrust::device_vector <int> vec(5,0);

vec [1] = 1;
vec [3] = 1;
vec [4] = 1;

// count the 1s
int result = thrust::count(vec.begin(), vec.end()
    , 1);
// result is three
```

Scans

A scan, also called a prefix-sum, applies a function to multiple sub-ranges of a vector and returns the result in a vector of the same size. The default function is addition.

```
#include <thrust/scan.h>
...
int data[6] = {1, 0, 2, 2, 1, 3};
thrust::inclusive_scan(data, data + 6, data);

/* data[0] = data[0]
 * data[1] = data[0] + data[1]
 * data[2] = data[0] + data[1] + data[2]
 * ...
 * data[5] = data[0] + data[1] +      + data[5]
 */

// data is now {1, 1, 3, 5, 6, 9}
```

Scans
Reordering
Sorting

Scans

There are *exclusive scans* in addition to *inclusive scans*:

```cpp
#include <thrust/scan.h>
...
int data[6] = {1, 0, 2, 2, 1, 3};
thrust::exclusive_scan(data, data + 6, data);

/* data[0] = 0
 * data[1] = data[0]
 * data[2] = data[0] + data[1]
 * ...
 * data[5] = data[0] + data[1] + ... + data[4]
 */

// data is now {0, 1, 1, 3, 5, 6}
```

Reordering

The "Reordering" utilities provides subletting and partitioning tools:

- ▶ thrust::copy_if(): copy the elements that make some logical function return true.
- ▶ thrust::partition(); reorder a vector such that values returning true precede values returning false.
- ▶ thrust::remove() and remove_if(): remove elements that return false.
- ▶ thrust::unique(): remove duplicates in a vector.

Sorting

```cpp
#include <thrust/partition.h>
...

struct is_even{
  __host__ __device__ bool operator()(const int &
      x){
    return (x % 2) == 0;
  }
};

int main(){
  int A[] = {1, 2, 3, 4, 5, 6, 7, 8, 9, 10};
  const int N = sizeof(A)/sizeof(int);
  thrust::partition(A, A + N,
                    is_even());

  // A is now {2, 4, 6, 8, 10, 1, 3, 5, 7, 9}
  return 0;
}
```

Sorting

`thrust::sort()`:

```
#include <thrust/sort.h>
...
const int N = 6;
int A[N] = {1, 4, 2, 8, 5, 7};
thrust::sort(A, A + N);
// A is now {1, 2, 4, 5, 7, 8}
```

`thrust::sort_by_key()`:

```
#include <thrust/sort.h>
...
const int N = 6;
int keys[N] = { 1, 4, 2, 8, 5, 7};
char values[N] = {'a', 'b', 'c', 'd', 'e', 'f'};
thrust::sort_by_key(keys, keys + N, values);
// keys is now { 1, 2, 4, 5, 7, 8}
// values is now {'a', 'c', 'b', 'e', 'f', 'd'}
```

Sorting

`thrust::stable_sort()`:

```cpp
#include <thrust/sort.h>
...
const int N = 6;
int keys[N] = { 1, 4, 2, 8, 5, 7};
char values[N] = {'a', 'b', 'c', 'd', 'e', 'f'};
thrust::sort_by_key(keys, keys + N, values);
// keys is now { 1, 2, 4, 5, 7, 8}
// values is now {'a', 'c', 'b', 'e', 'f', 'd'}
```

Materials
